PRODUCT REQUIREMENTS DOCUMENT

Back Office (BO) Panel

Sales & Distribution Platform | Telecom

Version 1.0 — Draft for Review
April 2026

Attribute	Detail
Document Type	Product Requirements Document (PRD)
Module	Back Office (BO) Panel — SND Platform
Industry	Telecom
Audience	Product, Engineering, QA, Design
Status	Draft — Open Decisions flagged as TBD
Version	1.0

1. Executive Summary

This document defines the product requirements for the Back Office (BO) Panel — an internal configuration and management web application that powers the Sales & Distribution (SND) platform for a Telecom company.

The BO Panel is not a customer-facing app. It is the control room — the place where administrators configure how the SND platform behaves, without writing a single line of code or raising a dev ticket.

Core Problem Statement

Today, every change to sales targets, KPIs, user hierarchy, territory assignments, and incentive rules requires a developer. This creates bottlenecks, delays business decisions, and makes the platform rigid. The BO Panel eliminates this dependency.

The Telecom SND platform handles a complex, multi-product distribution model — prepaid recharge, SIM activations, postpaid accounts, device distribution, and agents — with a top-down target-setting structure. The BO Panel must support this complexity through configurable, no-code management tools.

2. Goals & Success Criteria

2.1 Primary Goals

- Eliminate dev dependency for day-to-day business configuration changes
- Enable admin to fully manage the sales hierarchy, users, territories, KPIs, targets, and incentives from a single interface
- Provide management with real-time visibility into KPI achievement vs targets across the hierarchy
- Build a system flexible enough to support any hierarchy depth the business decides on

2.2 Success Metrics

Metric	Target	Notes
Dev tickets for config changes	0 per month (post-launch)	Baseline: multiple per week
Time to update monthly targets	< 30 minutes	Baseline: 2–3 days with dev
Time to onboard a new user	< 5 minutes by admin	Baseline: dev intervention required
Admin error rate on target cascade	< 2%	Validated with audit log
BO Panel uptime	> 99.5%	Admin tool — must be reliable

3. Users & Roles

The BO Panel serves two primary user types:

Role	Description	Key Capabilities
Super Admin	Full control. Typically 1–2 people (Tech/Ops lead).	All modules. Can create/delete other admins. System-level config.
Admin / Ops	Day-to-day configurers. 3–8 users typically.	Targets, users, hierarchy, KPIs, territories, incentives.
Management Viewer	Senior leadership. Read-only access.	Dashboards, KPI tracking, achievement reports. No edit rights.

Note on Field Users

Sales reps, agents, and distributors do NOT access the BO Panel. They use the SND mobile/field app. The BO Panel is strictly for internal ops and management.

4. Module Overview

The BO Panel consists of 8 core modules. Each module is described in detail in Section 5.

#	Module	Summary
M1	Hierarchy Management	Define and configure the org structure — levels, roles, and reporting lines
M2	User & Agent Management	Onboard, edit, deactivate users across all levels of the hierarchy
M3	Territory & Beat Management	Create and assign geographic territories, zones, circles, and beats
M4	KPI Configuration Engine	Add, edit, and manage KPIs without code — formula, type, frequency
M5	Target Setting & Cascading	Set top-level targets and cascade them down the hierarchy automatically
M6	Incentive & Payout Rule Engine	Configure commission slabs, bonuses, and payout rules per role/product
M7	Roles & Permissions	Control what each BO role can see and do within the panel
M8	Dashboard & Reporting	Management-facing views of live KPI achievement, ranking, and trends

5. Detailed Module Requirements

M1 Hierarchy Management

Purpose

Allow admin to define the sales org structure — how many levels exist, what each level is called, and who reports to whom — without touching the database.

Key Capabilities

- Define hierarchy levels (e.g. National Head → Zonal Manager → Regional Manager → Area Sales Manager → Territory Executive → Agent)
- Add, rename, or reorder hierarchy levels at any time
- The hierarchy depth must be fully configurable (not hardcoded) — supports 2-level to 6+ level structures
- Visualise the entire org tree from the BO panel (collapsible tree view)
- Move a node (person or team) from one parent to another — with impact preview before confirming
- Deactivate a level or role without deleting historical data
- Audit log of all hierarchy changes with timestamps and actor

Business Rules

- Each user must belong to exactly one node in the hierarchy (no dual-reporting by default; TBD if matrix reporting is needed)
- Deleting a node is blocked if it has active children — admin must reassign first
- Mid-period hierarchy changes (e.g. moving a rep mid-month) must preserve target achievement data under both old and new structure

Open Decision (TBD-01)

Hierarchy depth is not yet decided. The BO Panel must support dynamic depth (2–6+ levels). Recommend starting with a 4-level default (Zonal > Regional > Area > Agent) and making it configurable from Day 1.

M2 User & Agent Management

Purpose

Onboard, edit, activate/deactivate all people in the sales hierarchy — from senior managers down to the last-mile agents — without raising a dev ticket.

Key Capabilities

- Create user profiles: name, employee ID, phone, email, role, reporting manager
- Bulk onboarding via CSV upload (for agents especially — volumes can be high)
- Map each user to their position in the hierarchy tree
- Assign territory / beat to each user
- Toggle user status: Active / Inactive / Suspended
- View user's current KPIs, targets, and achievement from within the profile

- Re-assign a user's reporting line with one click
- For agents specifically: track onboarding status, KYC status (Pending / Verified / Rejected), agent code, and distributor they belong to
- Support different user types: Employee, Agent, Distributor, Retailer — each with different data fields

Agent-Specific Fields

Field	Type	Notes
Agent Code	Text	Auto-generated or manually assigned — TBD
KYC Status	Enum	Pending / Verified / Rejected / Expired
Distributor Link	Relation	Which distributor this agent operates under
Activation Date	Date	When the agent went live
Product Access	Multi-select	Which products/services the agent is authorized to sell
Bank / UPI Details	Encrypted	For incentive payouts — view restricted to Finance role

Open Decision (TBD-02)

Agent code generation — auto-generate with a prefix (e.g. AGT-00234) or allow admin to assign manually? Recommend auto-generate with override option.

M3 Territory & Beat Management

Purpose

Define geographic coverage areas and assign them to users — so that targets, reporting, and market share tracking are always geography-aware.

Key Capabilities

- Create geographic hierarchy: Zone > Circle > Region > District > Beat
- The territory hierarchy must also be configurable — not hardcoded
- Assign one or more territories to a user or team
- Move beats between regions without losing historical sales data
- View a map-based overview of territory assignments (nice-to-have for V1; required for V2)
- Mark territories as active/inactive (e.g. a new district is being added)
- Prevent duplicate territory assignments — one beat can only belong to one active rep at a time

Open Decision (TBD-03)

Geographic rollout scale is not yet decided (single city vs pan-India). The territory module must be built to scale from Day 1 — even if only 1 city is configured initially, the data model should support national rollout without a migration.

M4 KPI Configuration Engine

Purpose

Let admin define what a 'KPI' means in this system — without hardcoding it. A new business metric should take minutes to configure, not a sprint to build.

Key Capabilities

- Create a new KPI by defining: name, description, unit (number / percentage / currency / count), tracking frequency (daily / weekly / monthly), and which hierarchy levels it applies to
- Mark KPIs as primary (appears on main dashboards) or secondary (available in drill-down reports)
- Set whether a KPI is tracked at the agent/rep level, rolled up to manager, or both
- Define data source for each KPI: pulled from SND app, manually entered, or from external integration
- Activate / deactivate KPIs without deleting history
- KPI versioning — if a KPI definition changes (e.g. formula changes), old data retains original definition

Predefined KPI Catalog (Starter Set)

The following KPIs should be available out of the box at launch. Admin can add more:

KPI Name	Unit	Level
Revenue / Recharge Value	Currency (INR)	All levels
SIM Activations	Count	Agent, Area, Region
New Connections	Count	Agent, Area, Region
Data ARPU (Avg Revenue Per User)	Currency (INR)	Region, Zone
Market Share by Territory	Percentage (%)	Region, Zone, National
Agent Activation Count	Count	Area, Region
Active Retailer Count	Count	Area, Region
Outlet Visit Count	Count	Agent
Churn Rate	Percentage (%)	Region, Zone
Product-wise Sales (Prepaid / Postpaid / Fiber / Device)	Currency + Count	All levels

M5 Target Setting & Cascading

Purpose

Enable admin to set a top-level target number and cascade it intelligently down the hierarchy — the system distributes, the admin reviews, and confirmation locks it in.

Cascading Flow

1. Admin selects period (monthly by default), KPI, and sets the national/top-level target number
2. Admin chooses a cascade method: Equal split, Weighted by territory size, Weighted by historical performance, or Custom manual split
3. System generates a cascade preview — showing proposed targets at every level down to agent
4. Admin reviews the preview, can manually override individual nodes
5. Admin confirms and publishes — targets go live and become visible to all relevant dashboard views
6. Published targets can be revised (with a reason log) up to a configured lock date per period

Key Capabilities

- Targets can be set at monthly, quarterly, and annual frequency — independently
- Multi-KPI targeting — set targets for multiple KPIs in one session
- Cascade preview with visual diff before confirmation
- Override at any level during cascade (e.g. reduce target for a new region)
- Lock date configuration — after which published targets cannot be changed without Super Admin approval
- Bulk import targets via CSV for large-scale target setting
- Target history — view previous periods' targets vs actuals
- Alert admin if cascaded targets don't add up (rounding errors, orphan nodes)

Open Decision (TBD-04)

Cascade method default — should the system default to 'Weighted by historical performance' or 'Equal split'? Weighted is more sophisticated but requires at least one period of historical data to be meaningful. Recommend Equal Split as default for first 2 periods, then auto-switch to historical weighting.

M6 Incentive & Payout Rule Engine

Purpose

Allow admin to configure how agents and reps earn incentives — commission slabs, bonuses, product-specific payouts — without code.

Key Capabilities

- Create incentive plans: define name, applicable role, applicable product, effective date range
- Define slab-based rules: e.g. 0–50 activations = INR 20/activation, 51–100 = INR 25/activation, 100+ = INR 30/activation
- Define bonus rules: e.g. if agent achieves >90% of monthly target, bonus of INR 500
- Product-specific incentives: different rates for prepaid SIM vs postpaid vs fiber vs device
- Assign an incentive plan to a role, territory, or specific user
- Overlap conflict detection — system warns if two active plans apply to the same user
- Preview estimated payouts before publishing a new plan
- Payout calculation report — exportable for Finance team to process
- Incentive plan versioning — changing a plan doesn't retroactively affect past calculations

Open Decision (TBD-05)

Does the BO Panel process actual payouts, or just calculate and export? Recommend: BO generates the calculation report; actual disbursement is handled by Finance / payroll system. Integration to payroll is a V2 scope item.

M7 Roles & Permissions

Purpose

Control who in the BO Panel can see what and do what — without hardcoding permissions in code.

Key Capabilities

- Role-based access control (RBAC) — not user-level permissions (too granular to manage at 50–200 users)
- Predefined roles: Super Admin, Admin, Management Viewer (others can be added)
- For each role, configure: which modules are visible, whether they can read / write / delete in each module
- Data-level scoping: a Zonal Manager Viewer should only see data for their zone, not national data
- Audit log for all permission changes
- Session management: configurable inactivity timeout, force logout

Module	Super Admin	Admin	Mgmt Viewer
Hierarchy Management	Full	Full	View Only
User & Agent Management	Full	Full	View Only
Territory Management	Full	Full	View Only
KPI Configuration	Full	Full	View Only
Target Setting	Full	Full	View Only
Incentive Rules	Full	Full (no delete)	Hidden
Roles & Permissions	Full	View Only	Hidden
Dashboard & Reports	Full	Full	Full

M8 Dashboard & Reporting

Purpose

Give management and admin a live view of how the business is performing against targets — without needing to export data to Excel.

Key Capabilities

- National summary dashboard: total revenue, activations, ARPU, target achievement % — at a glance
- Drill-down by hierarchy: National > Zonal > Regional > Area > Agent
- KPI achievement heatmap: which zones/regions are green (on track) vs red (lagging)
- Period selector: view current month, last month, quarter, custom range
- Leaderboard view: top performers by KPI, filterable by level and territory
- Target vs Actual trend chart: line graph showing trajectory over the period
- Agent activation funnel: onboarded > KYC verified > first sale > active this month
- Export to Excel/CSV for any report view
- Scheduled email reports: admin can configure weekly summary emails to be sent to management

Open Decision (TBD-06)

Real-time vs batch data refresh. For a 50–200 person org, near-real-time (every 15–30 minutes) is sufficient and far simpler than live streaming. Recommend: refresh every 15 minutes with a 'Last updated at' timestamp shown on dashboard.

6. Non-Functional Requirements

Category	Requirement	Details
Performance	Page load < 3 seconds	All BO Panel pages must load within 3 seconds on standard broadband
Scale	Support 50–500 users	Built for 50–200 now; data model must handle 500+ without migration
Security	Role-based access strictly enforced	No user should be able to access data outside their scope
Security	All PII and financial data encrypted at rest	Agent bank details, KYC data
Security	Full audit trail	Every create / update / delete logged with actor, timestamp, before/after values
Availability	99.5% uptime SLA	Internal tool — planned maintenance windows are acceptable
Browser Support	Chrome, Edge, Safari (latest 2 versions)	Mobile browser support is nice-to-have; BO panel is desktop-first
Data Retention	7 years for financial data	Incentive calculations and payout records
Localisation	INR currency, IST timezone	Multi-currency / timezone as V2 if geographic expansion happens

7. Open Decisions & TBD Tracker

The following items are unresolved as of this draft and must be decided before development of the relevant module begins.

ID	Decision Required	Recommendation
TBD-01	Hierarchy depth — exact number of levels	Start with 4-level default; make fully configurable
TBD-02	Agent code generation — auto vs manual	Auto-generate with prefix; allow admin override
TBD-03	Geographic rollout scale — city vs national	Build data model for national scale Day 1; configure for current scope
TBD-04	Target cascade default method	Equal split for first 2 periods; weighted by history thereafter
TBD-05	Incentive payout — calculated in BO or processed here	BO calculates & exports; Finance system processes disbursement
TBD-06	Dashboard data refresh frequency	Every 15 minutes with 'Last updated' timestamp
TBD-07	Matrix / dual reporting — needed or not	Assume single reporting line for V1; flag if business has exceptions
TBD-08	External data source integrations (billing system, ERP)	Identify source systems and define data ingestion contracts in Tech spec

8. Out of Scope (V1)

The following items are explicitly excluded from the Back Office Panel V1. They are noted for future planning.

- Mobile app for BO Panel (desktop web only)
- Customer-facing portals or field rep apps (separate product)
- ERP / billing system integration (data ingestion contracts to be defined in Tech spec; integration is V2)
- Payroll / disbursement processing (Finance team handles this with BO export)
- AI-driven target recommendations (V2 — requires historical data first)
- Multi-language support (V2)
- Multi-currency support (V2 if geographic expansion)
- Matrix / dual-reporting hierarchy (V2 if business requires it)
- Advanced map-based territory visualisation (V2 — basic territory list is V1)

9. Suggested Build Phasing

Given the interdependencies between modules, the following build order is recommended:

Phase	Modules	Rationale
Phase 0 — Foundation	M7: Roles & Permissions + Auth	Everything else depends on who can do what
Phase 1 — Structure	M1: Hierarchy + M3: Territory	Users and targets can't be configured without structure
Phase 2 — People	M2: User & Agent Management	Onboard the actual users into the structure
Phase 3 — Measurement	M4: KPI Config + M5: Target Setting	Now that people and structure exist, set targets
Phase 4 — Incentives	M6: Incentive & Payout Rules	Requires KPIs and users to be in place
Phase 5 — Visibility	M8: Dashboard & Reporting	Valuable once data starts flowing

Recommended MVP Scope

Phases 0–3 (M7, M1, M3, M2, M4, M5) constitute the true MVP. These eliminate the biggest dev dependencies (hierarchy, users, targets). M6 and M8 can follow in the next sprint cycle.
